

Open Trim, Wet Location

Capri now offers an open rated shower trim for the 4" R4 series product and one for many of the 6" incandescent housings. The R4SHR is the 4" product, and the R6SHR is the 6" product catalog description.

This open lamp, wet location listed trim is ideal for locations where water will be present, both interior (shower) or exterior (NOTE: If a Capri downlight is to be installed outdoors, it must be in a covered ceiling application).

Many shower trims have lenses that are translucent. These lenses, which are "cloudy" in color, permit light to pass through, but they diffuse the light somewhat. The R4SHR and R6SHR open lamp trims do not have lenses on them, thus providing maximum illumination. Imagine the difference in output between a shower trim with a translucent lens that uses a 25w A19 lamp, and the R4SHR with a 50w Par30 lamp!!! The difference is very obvious.

It is important to understand that local inspectors will always have the final say in what lighting applications are or are not approved. Some inspectors will not approve an open lamp shower trim regardless of the UL listing. If this is the case, Capri offers many lensed shower trim options to choose from.

The appropriate, UL listed lamp will ship with these trims when they are ordered so that the customer will know exactly what item to order for relamping. The lamps we ship are Sylvania indoor/ outdoor rated Par lamps. The 4" shower trim requires a Par30 lamp, and the 6" shower trim utilizes a Par38 lamp.
